

**Planetgear™ 7000 Speed Reducer** | Proven, Reliable, Rugged  
(English-Inch)

# PLANETGEAR™ 7000 SPEED REDUCERS

## Proven, Reliable, Rugged

Rexnord introduces a new design concept for increased capacity. The new Planetgear 7000 integrates enhanced mechanical geometry with refined material processes, resulting in torsional increases of 15% to 50%.

New Planetgear 7000 sizes are backward interchangeable for maximum adaptability and reduced changeover expense.

Planetgear 7000 Speed Reducers incorporate all of the standard Planetgear features you have come to expect for your heavy-duty applications. The self-aligning gear train has six or more teeth in contact per reduction to equally share the load. Large tapered roller bearings on heavy-duty shafts provide high overhung load and thrust capacity.

### Features & Benefits

- Backwards Interchangeable - New design fits in the same footprint for easy changeover.
- Reliable Operation - Self-aligning planet carriers float radially and axially to provide perfect alignment of drive train when handling punishing heavy-duty applications.
- Durable and Rugged - State-of-the-art materials and processes provide hardened wear-resistant gearing. Self-aligning gear train ensures equal load distribution. Components are spline connected, isolating gear train from external forces. Handles heavy shock loads.
- Easy to Service - No special tools required for changing wear items. No shimming required to set the bearing clearances. Increased uptime.
- Fast, Easy Ratio Changes - Planetgear 7000 uses standard sub-assemblies which allow fast gear ratio changes in the field. No bearing adjustments are required – just change and go. Reduced inventory.
- Dual Seal Protection - Taconite duty-rated seal is standard. Two seals on each shaft provide a purgeable grease cavity to keep dirt and moisture out.

### Rating and Torque Data

Reducer Series	Mercury	Mars	Venus	Atlas	Luna	Earth	Polaris	Delta	Neptune	Neptune Plus	Orion Plus	Saturn Plus	Titan Plus	Jupiter Plus
	7200	7220	7240	7260	7280	7300	7320	7340	7360	7380	7400	7420	7440	7460
Torque (lb-in)	3,000-8,000	7,000-18,000	16,000-24,000	26,000-43,000	37,000-51,000	42,000-76,000	52,000-120,000	40,000-154,000	45,000-160,000	117,000-238,000	117,000-316,000	250,000-450,000	405,000-643,000	522,000-905,000

Planetgear 7000 now offers a total of 14 sizes including the newly designed sizes: NeptunePlus, OrionPlus, SaturnPlus, TitanPlus, and JupiterPlus. There are two new sizes, Luna (same footprint as Atlas) and Delta (same footprint as Polaris), that provide additional torque intervals to suit your application needs.

Since 1981, the benefits of our self-aligning planetary gear train have been proven in application after application.

Planetgear performance has withstood many tough environments, including shock loads, frequent reversals and hostile atmospheres containing moisture and abrasives. Planetgear continues to enhance capacity and performance based on customer demands.

### New Design Concept

Improvements in gear geometry and enlarged component dimensions – combined with higher capacity bearings – achieve increased torque capacities. This produces a more power-dense gear design with smaller size and weight for the same application.

# ADDITIONAL FEATURES AND BENEFITS

## Fast Delivery

All parts in stock. Only an assembly operation is required, thus 48 hour delivery is available. Two week shipment is standard.

## Reliable Operation

Self-aligning planet carrier floats radially and axially to provide perfect alignment of drive train. At least six teeth share the load at each reduction to distribute the load.

## Simplified Installation

Output and input shafts rotate in the same direction regardless of the number of reductions.

## Durable, Rugged

State-of-the-art heat treating techniques provide hardened, wear-resistant gearing. Self-aligning gear train insures equal load distribution among the planet gears. Spline connection between input/output shafts and gearing isolates gears from external forces.

## Double Seal Protection

Taconite duty-rated seal design is standard. Two seals on each shaft provide a grease purgeable cavity to keep out dirt and moisture.

## Extended Bearing Life

Tapered roller bearings on both input and output shafts provide high overhung and thrust load capacity. Shaft bearings are subject to external forces only — not internally generated gear forces.

## Efficient

Efficiency in excess of 97.5% per reduction provides energy saving operations.

## Easy to Service

No special tools required to assemble or disassemble. No shims required to set the bearing clearances.

## Saves Time

Lightweight. Safe, easy mounting and handling is achieved with up to 50% weight reduction when compared to conventional drive units.

## Application Flexibility

Complete line of accessories are available to accommodate any application. Even vertical service is available with only slight modifications to units.

## Fast, Easy Ratio Changes

The drive consists of standardized sub-assemblies which allow fast gear ratio changes in the field: Ratios can quickly be changed since there are no internal walls to work around, and no bearing adjustments are required.

*Single Reduction*

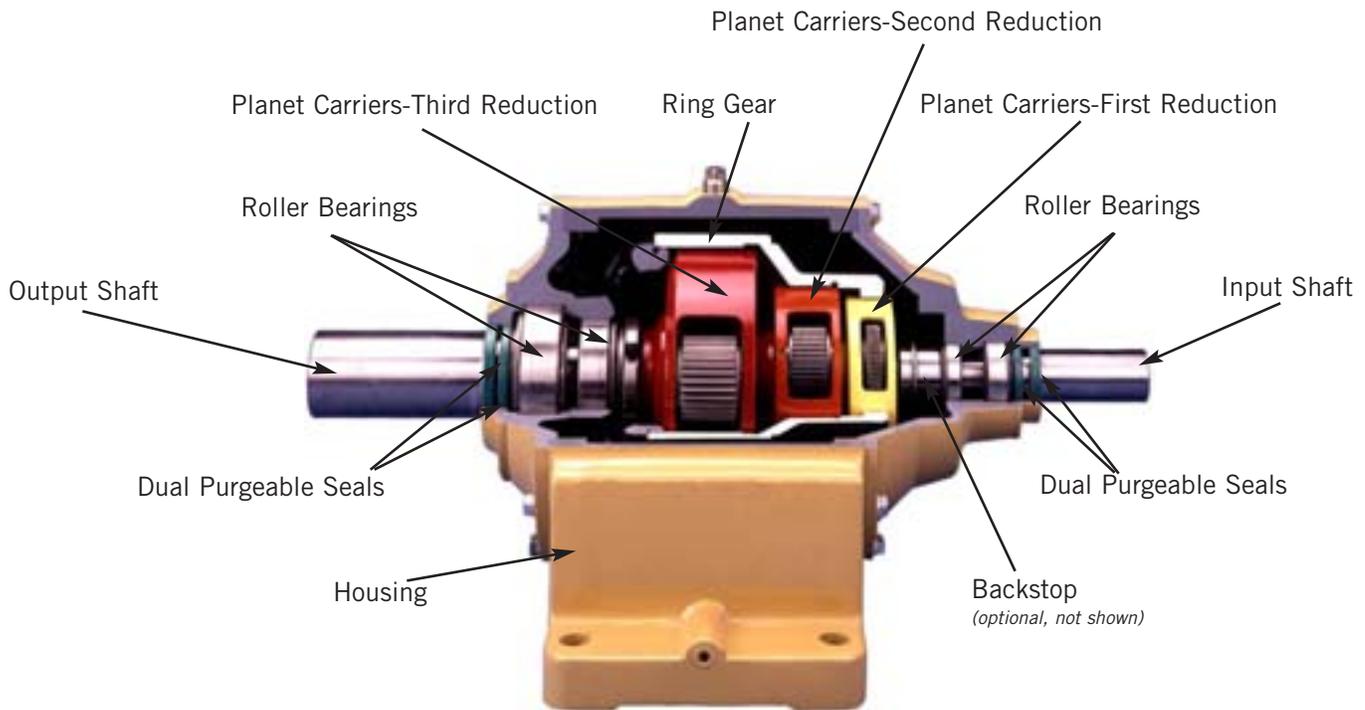

*Double Reduction*

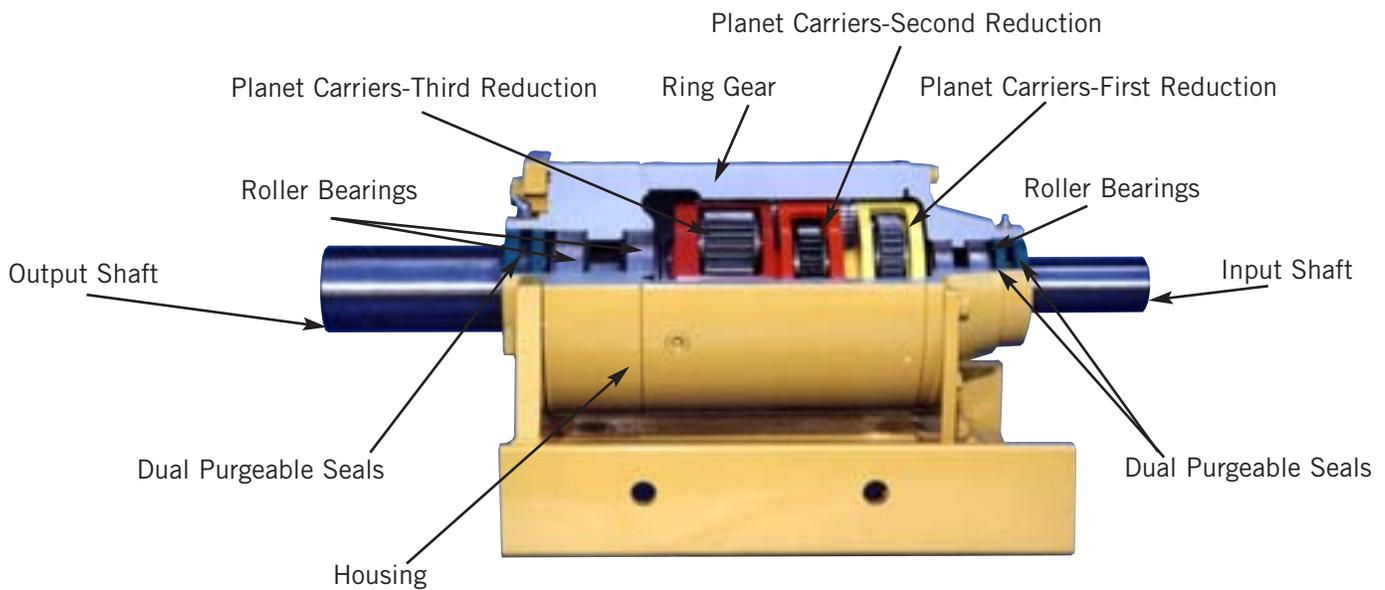

*Triple Reduction*

## Accessories

*Rigid scoop facilitates mounting and alignment of most motor frame sizes and eases final installation of the drive package.*

*Fans and shrouds furnished to maximize lubricant life and reducer performance.*

*Planetgear™ motor mount saves space and allows precise speed adjustment.*

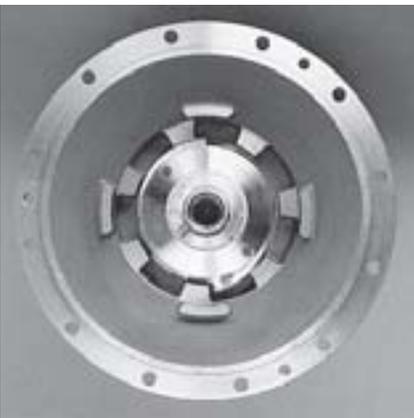

*Slidebases available for all reducers to facilitate chain tensioning.*

*Reducers are easily modified for vertical service with either low speed or high speed shaft down.*

*Flanged motor mounts are available in Mercury through Polaris sizes, for NEMA frame sizes 56C to 286TC.*

*Internally mounted, oil lubricated backstops are available for all Planetgear 7000 reducers. Backstops are not limited by load, duration, or frequency of operation. They can operate in extreme pressure oil, and can be installed in the field without removal of gearing.*

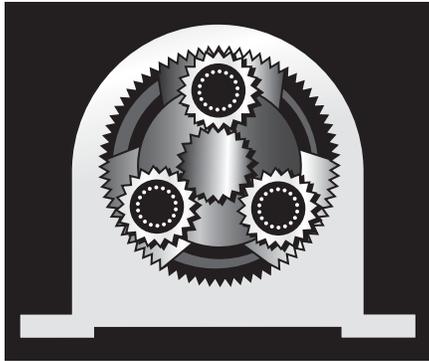

*Large motors are easily accommodated on sturdy baseplates. Planetgear will furnish motors or mount those furnished by others.*

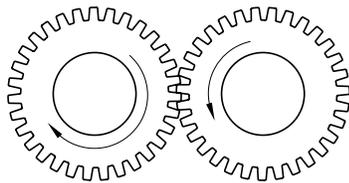

*Custom adapters are available to facilitate mounting configurations.*

## Proven, Reliable Gear Performance

With Planetgear™ 7000 reducers, self-aligning planet carriers float radially and axially to provide perfect alignment of the gear train. Unlike "traditional gears" which have only one point of contact per reduction, Planetgear 7000 transmits the torque through three points of contact between sun gears and planet gears. The floating gear train ensures equal loading among the three points. State of the art heat-treating techniques provide hardened, wear-resistant gearing.

← *Three points of contact*

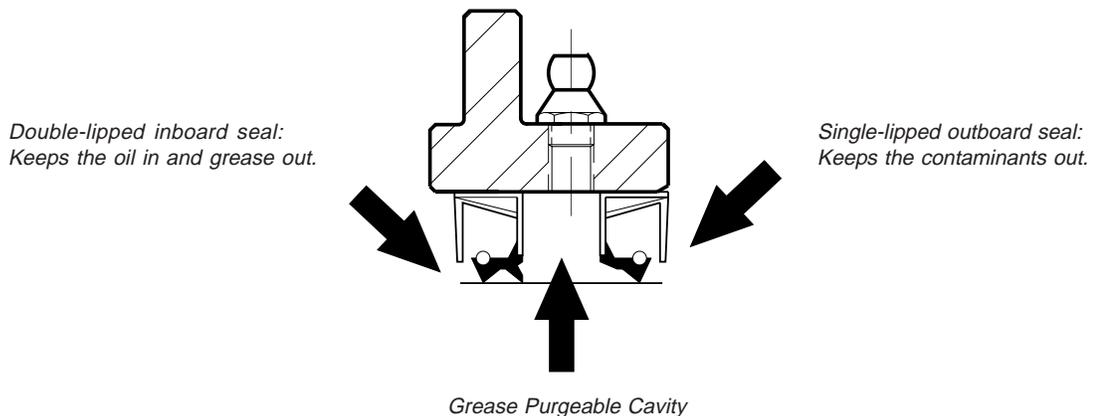

*Traditional Gears — only one point of contact*

---

## Superior Seal Protection

How many reducer failures are attributed to bearing contamination?

Planetgear 7000 reducers are designed with **TWO** seals on both the input and output shafts. Our successful seal layout can be seen in the schematic shown below.

Planetgear 7000 reducers assure you extended reducer service-life even in the worst environments.

# SELECTION PROCEDURES

## General Selection Information

### INTRODUCTION

Before a reducer can be selected for any application, the equivalent output torque or horsepower must be computed by multiplying the actual or specified torque or horsepower by the service factor (S.F.) for the particular load classification for which the unit is to be used. It is necessary that the unit selected have a capacity equal to or in excess of the equivalent output torque (lb-in) or horsepower.

Reducers can be selected by Service Factor or Load Classification. Both Service Factors and Load Classifications are a means of classifying different equipment and applications into a uniform guideline useful for reducer selection. Due to variations in application, service factors are used to adjust equipment ratings to accommodate differing load conditions. Applications involving unusual or severe loading should be carefully reviewed before a service factor is applied (consult factory). Care must be taken by the customer to isolate the reducer from unplanned transient loads or vibrating conditions.

For unusual application requirements such as those listed below, consult the factory for application assistance.

- Temperatures less than 15°F (-9°C) or more than 125°F (52°C).
- Corrosive, chemical or explosive fumes.
- Tilted, rotated ceiling, wall or submerged mounting requirements.
- Unusual atmosphere such as vacuum, high pressure, or high altitude.

### Momentary Overloads

The maximum momentary or starting load applied to a reducer must not exceed 250% of rated load. Rated load is defined as the reducer rating at a service factor of 1.0. Applications with high torque motors and motors for intermittent operations should be referred to the factory. Also, applications where extreme repetitive shock occurs or when high-energy loads must be absorbed, as when stalling, require special considerations and should be referred to the factory.

### Brake Loads

When drives are equipped with brakes on the input, and the torque rating of the brake exceeds the rating of the motor, the rating of the brake dictates the selection of the reducer.

### Operating Temperature

It is important the maximum oil temperature not exceed 200°F (93°C). If a continuous ambient temperature of 115°F (46°C) or higher exists, please contact the factory. Thermal limitations may exist for some units with low ratios. Heat exchangers are available for these applications that exceed the thermal capacity of reducers with fans and shrouds.

### Thermal Capacity

Heat exchangers are available for those applications that are thermally limited, contact factory.

### Moment of Inertia

The moment of inertia values are listed in **Table 16, page 64.**

### Lubrication

Planetgear™ 7000 reducers are shipped without oil and must be filled to the specified oil level before start-up. Lubrication instructions can be found on the reducer nameplate, including required frequency of oil changes. Additional information on lubrication and oil capacities are listed in the Owners Manual.

### Multi-Speed Selections

Reducers that will be operated at a variety of input speeds must be selected for the speed that yields the highest output torque requirement.

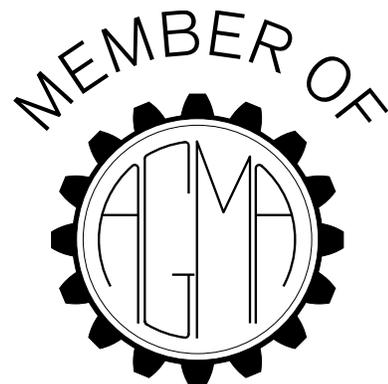

### Backstops

Reverse rotation is prevented through the use of Planetgear backstops on all reducer series. The ratchet mechanism engages at any frequency for any time span, thus providing indexing, or positioning capabilities. The pawls disengage by centrifugal force assuring quiet operation.

Our internally mounted backstops operate in conventional gear oil.

Available as stocked accessories, they are easily installed or reversed in the field without removal of gearing. Conversion of our standard Mercury and Mars models requires a complete backstop input endbell assembly.

When ordering a Planetgear 7000 reducer with a backstop, indicate the reducer rotation as clockwise or counter-clockwise when looking towards the reducer from the low speed end. Note: consult factory if using a backstop in an application that has an input speed of 400 RPM or less.

# SELECTION PROCEDURES

## Motorized Selection (Scoop Mount and C-face)

Three classes designated by Roman Numerals I, II and III were established by NEMA to relate the package or "Drive" to a large variety of applications. These applications were classified by load factors and hours per day of use. A service classification table using this nomenclature for typical applications is located on **pages 6 & 7**. Reducer selections can be made based on applying these service classifications to specific motor ratings and speeds.

Planetgear™ 7000 scoop mounted motor reducers are available for all reducer series with capacities ranging from 1 horsepower (143T) to 250 horsepower (447T). These may be a face mounted or common base type configuration depending upon the motor size. Planetgear can furnish motors or mount those furnished by others.

Rexnord Omega couplings are standard on the high speed shaft of scoop mounted reducers. Selections for the Omega coupling can be found in **Table 7 on page 52**. A wide choice of accessories including backstops, slidebases, and coupling guards are also available.

Planetgear C-face mounted motor reducers are available for Mercury through Polaris, and Neptune, Neptune Plus and Orion Plus quadruple and quintuple series. Horsepower capacities range from 1/2 horsepower (56C) to 30 horsepower (286TC). Planetgear can furnish motors or mount those furnished by others. Reference **Figure 1, page 69** for sectional view of C-face input.

### Planetgear Selection Procedure - Reducer with Scoop or C-face Mount

#### Step 1 — Determine the service class

**Table 1, pages 6 & 7** lists service classes by industry, type of service, and hours per day of operation.

#### Step 2 — Selecting the unit size

**Table 3, pages 14 - 25** list scoop mount selections for service class I, II and III for 1750 RPM motors. **Table 4, pages 26 - 28** list C-face mount selections for service class I, II and III for 1750 RPM motors.

Read the series name under the desired motor horsepower and opposite the approximate output speed required. The number following the reducer name in the selection table is the output capacity in (x1000) pound-inches of torque.

**Note: If ambient temperature exceeds 84°F (29°C), see Step 6 of Non-motorized selection procedure to determine reducer thermal rating.**

#### Step 3 — Check for Overhung Load

Follow the overhung load procedure on **page 12** to confirm the selection when radial loads exist on the output shaft. For units that have a thrust load applied, contact factory with radial and thrust load information.

#### Step 4 — Check the Dimensions

Refer to the dimensional drawings on **pages 35 to 40** for feet mounted motors, and **pages 41 to 42** for C-face reducers. Confirm the spacial requirements of the selected reducer.

#### Step 5 — Viva & Omega Coupling Selection (scoop mount reducers only)

Refer to **Table 7 page 52** for selection information based on reducer series and load classification.

Note: Scoop mount reducers include face scoops and baseplates.

#### Step 6 — Order the Planetgear Reducer

Refer to **page 13** for information required when ordering reducers.

### SELECTION EXAMPLE — REDUCER WITH SCOOP MOUNT

#### REQUIRED:

A drive for a uniformly fed chain conveyor operating 16 hours per day is powered by a 10 hp, 1750 rpm (215T frame) motor. Desired reducer output speed is 41 rpm. A roller chain drive having a 160B17 roller chain sprocket (10.844 inches Pitch Diameter) is mounted so that the centerline of the load is 2 1/2 inches from the reducer seal cage.

#### SOLUTION:

#### Step 1 — Determine service class

Since 16 hours per day is greater than 10 hours per day, Class II is chosen from **Table 1 on pages 6 & 7**.

#### Step 2 — Determine the unit size

From Class II selection, reference **Table 3 on pages 18 and 19** for 1750 rpm. Locate the desired input motor horsepower column (10 hp) and read the reducer name opposite the approximate output speed that is closest to the desired value. Select Venus series with 40 rpm approximate output speed and 43.78 nominal ratio.

#### Step 3 — Check for overhung and thrust loads

(See calculation instructions **page 12**)

$$\text{OHL} = \frac{(126,000)(10)(1.0)(0.96)}{(10.844)40} = 2,788 \text{ lbs.}$$

The overhung load capacity from **Table 11 on page 54** for Venus reducer having 43.78 nominal ratio is 9,630 pounds. The rated capacity is greater than the actual value, therefore the selection is approved.

#### Step 4 — Check Dimensions

The dimensional drawing on **page 29 to 39** shows the Venus reducer with Scoop Mount and Slidebase.

- Series name = Venus
- Class of service = Class II
- Input motor hp = 10 hp
- Motor frame size = 215T
- Input motor speed = 1750 rpm
- Nominal ratio = 43.78
- Desired accessory = Slidebase, Scoop Mount, Coupling and Guard

◆ DRY DOCK CRANES (Hammerhead, Rotating and Whirler, Stationary or Moving) for any duration of service: Main Hoist, Auxiliary Hoist, Boom (Lifting): 3.00 S.F.; Rotating (Swing or Slew): 3.00 S.F.; Tracking (Drive Wheels): 3.00 S.F.

● Service factors for paper mill application are applied to nameplate rating of electric motor at the motor rated base speed - consistent with TAPPI Standards.

△ When a super calender operates over a speed range of part constant hp and torque and the constant hp speed range is greater than 1.5:1, use a service factor of 1.0 at base speed. When operating at constant torque over the entire speed range or when the constant hp speed range is less than 1.5:1 a 1.25 factor should be applied.

# SELECTION PROCEDURES

## Non-Motorized Selection (For motorized reducer selections, see page 5)

### Introduction

Selection and pricing of Planetgear™ 7000 is based solely on the required output torque capacity of the application. The service factor method is used to apply specific industry application standards based on the hours per day of operation. These application standards are cataloged and have been developed based on practical application experience.

The following information demonstrates how this procedure allows the selection of the most economical Planetgear reducer.

### Information Required To Make Reducer Selection

- The specific application and hours per day of operation.
- Reducer input speed.
- Input Horsepower.
- Desired reducer output speed.
- If applicable, overhung load.

### Step 1 — Determine Service Factor

Select the appropriate service factor **Table 2** on **pages 10 & 11** for the industry and specific applications at hand. These service factors are designed for applications driven by electric motors.

If a single or multiple cylinder engine is used, adjust the service factor that is taken from **Table 2** with the corresponding values listed below.

Steam & Gas Turbines Hydraulic or Electric Motors	Single Cylinder Engines	Multi-Cylinder Engines
1.00	1.50	1.25
1.25	1.75	1.50
1.50	2.00	1.75
1.75	2.25	2.00
2.00	2.50	2.25

Pre-selection tables are available for horizontal mounting and input speeds of 1750 rpm and service factors of 1.0, 1.25, 1.4, 1.5, 1.75 and 2.0. Use tables for selection purposes when possible. For speeds other than those listed, continue with the selection procedures as follows:

### Step 2 — Calculate the desired reducer ratio (D.R.) using:

$$D.R. = \frac{\text{Input Speed (RPM)}}{\text{Output Speed (RPM)}}$$

### Step 3 — Select closest nominal ratio (N.R.)

**Table 15** on **page 63** lists the nominal ratios offered by Planetgear. Pick the ratio that is closest to the desired ratio calculated in Step 2.

### Step 4 — Calculate equivalent output torque (E.O.T.) using:

A. When input motor horsepower is known:

$$E.O.T. = \frac{HP \times N.R. \times S.F. \times 59,900}{RPM_{in}}$$

**Note: 59,900 is used to represent the average mechanical efficiency of reducers (59,900 = 63,025 x 95%).**

B. Where required output torque is known:

$$E.O.T. = T_o \times S.F.$$

where:

- HP = Motor horsepower
- N.R. = Nominal ratio from Step 3
- S.F. = Service factor from Step 2
- RPM<sub>in</sub> = Reducer input shaft speed in revolutions per minute
- T<sub>o</sub> = Output torque required in lb-in

### Step 5 — Select reducer

Reference **Table 5, "Technical Information Selection", pages 43 to 49** and locate the nominal ratio determined from Step 3. Locate the smallest series (Mercury, Mars, Venus, Atlas, Luna, Earth, Polaris, Delta, Neptune, Neptune Plus, Orion Plus, Saturn Plus, Titan Plus or Jupiter Plus), that offers the output torque (lb-in) rating that is equal to or greater than the equivalent output torque (E.O.T.) determined from Step 4 for the nominal ratio required.

### Step 6 — Check thermal capacity

Checking the thermal rating is extremely important. If the drive creates heat faster than it can be dissipated, it will overheat, and severe damage may occur.

The thermal rating of a drive is the actual power in horsepower (without

Service Factor) that a drive can transmit continually for three hours or more without overheating.

Thermal ratings must be considered when the continuous operating period exceeds 3 hours, or if operation exceeds 3 hours and the running time is greater than the shutdown time.

### Application Adjusted Thermal Rating

The application adjusted thermal rating must be greater than the actual power transmitted through the gear drive (frequently the power rating of the driving motor is used rather than the actual power transmitted). To determine the application adjusted thermal rating, look up the basic thermal rating for the drive size and ratio selected, **Tables 12 and 13, pages 55 to 63**. Determine the application adjusted thermal rating by using the appropriate correction factors. Compare the actual power rating required (without Service Factor) with the application adjusted thermal rating. If the actual power rating exceeds the application adjusted thermal rating, shaft fans or electric fans may be added, an optional heat exchanger package may be added, or a larger drive may be selected. Review all the footnotes for the basic thermal rating to be certain which cooling accessories are available for the selected drive.

Application adjusted thermal rating is determined by using the following:

$$P_{TA} = B_1 \times B_2 \times B_3 \times B_5 \times P_T \text{ where:}$$

P<sub>TA</sub> = Application adjusted thermal rating

P<sub>T</sub> = Basic thermal rating from the tables in this selection guide

B<sub>1</sub> = Ambient temperature factor

B<sub>2</sub> = Altitude factor

B<sub>3</sub> = Ambient air velocity factor (used only if auxiliary cooling is used)

B<sub>5</sub> = Duty Cycle factor

Ambient Temperature Factor - B <sub>1</sub> (For all cooling methods)		Altitude Factor - B <sub>2</sub> (For air cooling only)	
Ambient Temperature *	Factor with or without Shaft or Electric Fan	Altitude - ft Sea level = 0	Factor with or without Auxiliary Cooling
50°F	1.19	0 to 2,500	1.00
60°F	1.13	2,500	.95
70°F	1.07	5,000	.90
80°F	1.00	7,500	.85
90°F	.93	10,000	.81
100°F	.85	12,500	.76
110°F	.78	15,000	.72
120°F	.69	17,500	.68

\* Factors for other ambient temperatures can be interpolated.

Ambient Air Velocity Factor - B <sub>3</sub> (For no auxiliary cooling only)		
Sustained Ambient Air Velocity - fpm	Installed Environment	Factor without Shaft or Electric Fan
Less than 100 fpm (1 mph)	Small Confined Space	.75
Between 100 fpm & 275 fpm (1 to 3 mph)	Large Indoor Room	1.00
Between 275 fpm & 725 fpm (3 to 8 mph)	Large Indoor Room	1.40
Greater than 725 fpm (8 mph)	Outdoors	1.90

Duty Cycle Factor† - B <sub>5</sub> (For all cooling methods.)	
% Operating Time Per Hour	Factor
100%	1.00
80%	1.05
60%	1.15
40%	1.35
20%	1.80

† The duty cycle factor must be based on the percentage of each hour that the drive is operating. For example: a gear drive operating for 48 minutes and resting for 12 minutes every hour of the day has an 80% duty cycle, but a drive operating for four hours and resting for four hours has a 100% duty cycle. Where % run time per hour falls between values shown above, use next higher % run time.

### Step 7 — Check overhung load

When overhung load exists on either input or output shafts, follow the appropriate explanation on **page 12** to confirm the reducer selection. For units that have a thrust load applied, contact factory with radial and thrust load information.

### Step 8 — Check dimensions

Dimensional drawings for reducers with and without accessories are found on **pages 29 to 42**.

### Step 9 — Ordering reducers

See reducer order form **page 13**.

# SELECTION PROCEDURES

## Selection Examples — Reducer Only (Non-motorized)

### When motor horsepower is known:

A 100 hp 1,750 rpm motor is used to drive a heavy duty horizontal apron conveyor 24 hrs/day. The conveyor requires a reducer output speed of 50 rpm. A roller chain drive having a 240B25 tooth roller chain sprocket (23.936" Pitch Diameter) is mounted with the center of the chain pull 4.5 inches from the seal cage. Ambient temperature is 80°F.

#### Step 1 — Select service factor

From **Table 2** on **pages 10 & 11**, the service factor for an apron conveyor 24 hrs/day operation is 1.5.

#### Step 2 — Calculate desired ratio (D.R.)

$$\text{D.R.} = \frac{1,750 \text{ RPM}}{50 \text{ RPM}} = 35$$

#### Step 3 — Select closest nominal ratio (N.R.)

Select **Table 15** on **page 63** = 36.56

$$\text{Output Speed} = \frac{1,750 \text{ RPM}}{36.56} = 47.9 \text{ RPM}$$

#### Step 4 — Calculate equivalent output torque (E.O.T.) hp method

$$\text{E.O.T.} = \frac{100 \text{ hp} \times 36.56 \text{ N.R.} \times 1.5 \text{ S.F.} \times 59,900}{1,750 \text{ (input RPM)}} = 187,709 \text{ lb.-in.}$$

#### Step 5 — Select reducer

Enter **Table 5**, Reducer Only Selection, located on **pages 43 to 49**. Nominal ratio is 36.56. The smallest series listed for the E.O.T. calculated in Step 4 (187,709 lb.-in.) is an Orion Plus.

#### Step 6 — Check thermal capacity

Compare the motor horsepower to the thermal ratings of the reducers with the following formula:

$$\text{Motor HP} \leq (\text{Tr})A_c$$

Since the thermal rating in **Table 12**, **page 55** without fan is less than the motor HP,  $\text{Tr} = 124$  with a cooling fan. See instructions from page 8 for thermal adjustments.

$$\begin{aligned} 100 \text{ (Motor HP)} &\leq 124 \text{ (hp rating)}(1.0) \\ 100 &< 124 \end{aligned}$$

Since the motor horsepower is less than the thermal rating, the thermal capacities of the reducer with cooling fan exceeds the motor capacity.

#### Step 7 — Check for overhung and thrust loads

The overhung load (O.H.L.) exists on the output shaft. The input shaft is direct connected and does not encounter overhung load. Therefore (from **page 9**):

$$\text{O.H.L.} = \frac{126,000 \times 100 \text{ hp} \times 1.0 \text{ Fc} \times 0.96 \text{ Lf}}{23.936" \text{ P.D.} \times 47.9 \text{ (output (RPM))}} = 10,550 \text{ lbs.}$$

The overhung load capacity from **Table 11**, **page 54** for a Orion Plus series having a output speed approximately 48 rpm is 27,100 lbs. The rated capacity is greater than the actual value, so the selection is approved.

**This application does not encounter thrust load.**

#### Step 8 — Check dimensions

Dimensions for the Orion Plus series are on **page 30**.

#### Step 9 — Order Planetgear reducer by:

- Series Name - Orion Plus
- Nominal Ratio - 36.56
- Output torque rating - 274,000 lb.-in.
- Input motor horsepower - 100 hp
- Service Factor - 1.5
- Input Speed - 1,750 rpm
- Desired Accessories - none

### When required output torque is known:

A heavy duty bucket elevator is operating 24 hrs/day. The elevator requires a reducer including backstop with a 157 rpm output speed (1,750 rpm input) and 24,000 lb-in output torque. Overhung and thrust loads are not a factor. Reducer will be driven with a 60 hp motor.

#### Step 1 — Select service factor

From **Table 2** on **pages 10 & 11**, the service factor for a heavy duty bucket elevator 24 hrs/day operation is 1.5.

#### Step 2 — Calculate desired ratio (D.R.)

$$\text{D.R.} = \frac{1,750 \text{ RPM}}{157 \text{ RPM}} = 11.15$$

#### Step 3 — Select closest nominal ratio (N.R.)

Select from **Table 16** on **page 109**, N.R. = 11.02

$$\text{Output Speed} = \frac{1,750 \text{ RPM}}{11.02} = 159 \text{ RPM}$$

#### Step 4 — Calculate equivalent output torque (E.O.T.)

Since output torque is known:

$$\text{E.O.T.} = 24,000 \text{ (output torque in lb.-in.)} \times 1.5 \text{ (service factor)} = 36,000 \text{ lb.-in.}$$

#### Step 5 — Select reducer

Enter **Table 5**, "Reducer Only Selection", located on **pages 43 to 49**. Nominal ratio is 11.02. The smallest series listed for the E.O.T. calculated in Step 4 (36,000 lb.-in.) is a Atlas at 36,000 lb.-in.

#### Step 6 — Check thermal capacity

Enter **Table 12**, "Thermal Capacity", on **page 55**. Locate Atlas series, 11.02 ratio in the left hand column. The input speed is 1,750 RPM and maximum horsepower is 18 without a fan 63 with a fan.

#### Step 7 — Check for overhung and thrust loads

Overhung and thrust loads are not a factor in this example.

#### Step 8 — Check dimensions

Dimensions for the Atlas series are on **page 30**.

#### Step 9 — Order Planetgear reducer by (see **page 13**):

- Series Name - Atlas
- Nominal Ratio - 11.02
- Output Torque Rating - 36,000 lb.-in.
- Input Motor Horsepower - 60 hp
- Service factor - 1.5
- Input Speed - 1,750 rpm
- Desired Accessories - backstop with desired rotation

# SELECTION PROCEDURES

## Service Factor Selections

### TABLE 2 - SERVICE FACTORS

APPLICATION	SERVICE		APPLICATION	SERVICE		APPLICATION	SERVICE	
	10 HRS/DAY	24 HRS/DAY		10 HRS/DAY	24 HRS/DAY		10 HRS/DAY	24 HRS/DAY
AGITATORS			Clay Working Machinery	1.25	1.50	FANS

◆ DRY DOCK CRANES (Hammerhead, Rotating and Whirler, Stationary or Moving) for any duration of service: Main Hoist, Auxiliary Hoist, Boom (Lifting): 3.00 S.F.; Rotating (Swing or Slew): 3.00 S.F.; Tracking (Drive Wheels): 3.00 S.F.

● Service factors for paper mill application are applied to nameplate rating of electric motor at the motor rated base speed - consistent with TAPPI Standards.

△ When a super calender operates over a speed range of part constant hp and torque and the constant hp speed range is greater than 1.5:1, use a service factor of 1.0 at base speed. When operating at constant torque over the entire speed range or when the constant hp speed range is less than 1.5:1 a 1.25 factor should be applied.

\* Consult Factory. \*\* See Mills, Rotary. ■ Using anti-friction bearings only. □ See Rubber & Plastics Industries

◆ DRY DOCK CRANES (Hammerhead, Rotating and Whirler, Stationary or Moving) for any duration of service: Main Hoist, Auxiliary Hoist, Boom (Lifting): 3.00 S.F.; Rotating (Swing or Slew): 3.00 S.F.; Tracking (Drive Wheels): 3.00 S.F.  
● Service factors for paper mill application are applied to nameplate rating of electric motor at the motor rated base speed - consistent with TAPPI Standards.  
Δ When a super calender operates over a speed range of part constant hp and torque and the constant hp speed range is greater than 1.5:1, use a service factor of 1.0 at base speed. When operating at constant torque over the entire speed range or when the constant hp speed range is less than 1.5:1 a 1.25 factor should be applied.  
\* Consult Factory. \*\* See Mills, Rotary. ■ Using anti-friction bearings only. □ See Rubber & Plastics Industries

# SELECTION PROCEDURES

## Thrust and Overhung Loads

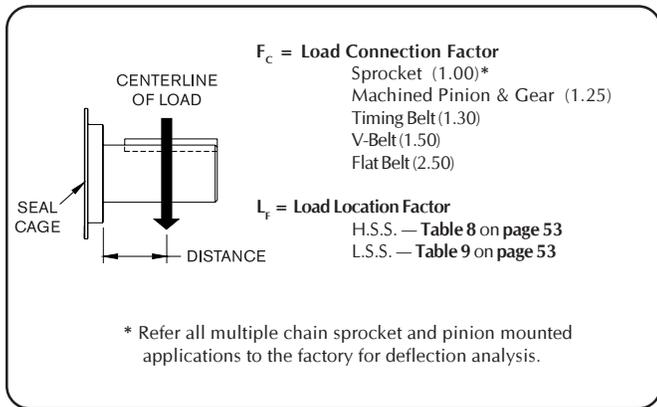

### Thrust Loads

Thrust loads applied to reducer shafts through coupling connections often are combined with radial shaft loads. Since this combined loading affects bearing thrust capacities, these values may be obtained by contacting the factory.

### Overhung Loads

The center line of the overhung load should be as close as possible to the seal cage to minimize bearing load and improve bearing life. The formula for determining overhung load in pounds is as follows:

$$\text{Overhung Load in Pounds} = \frac{126,000 \times \text{HP} \times F_c \times L_f}{\text{P.D.} \times \text{RPM}}$$

Capacities listed on pages:

**Table 10 on page 54** High Speed Shaft

**Table 11 on page 54** Low Speed Shaft

where:

- HP = Horsepower without service factor
- F<sub>c</sub> = Load connection factor – see above
- L<sub>f</sub> = Load location factor - see above
- P.D. = Pitch Diameter in inches
- RPM = Shaft revolutions per minute

If the actual overhung load exceeds the published capacity, the following may be assistance to reduce the overhung load on the shaft bearings.

1. Increase the pitch diameter of sheave or sprocket.
2. Locate the sprocket or belt closer to the seal cage.
3. Go to the next larger reducer series.

### Example:

#### High Speed Shaft

A 10 HP, 1,750 RPM motor with 5.5" Pitch diameter sheave is V-belt connected to an 8.2" sheave mounted on an Atlas series reducer having a ratio of 54.45, an output torque capacity of 30,000 lb.-in. and a 21.5 RPM output speed. The centerline of the sheave on the reducer is mounted two inches from the seal cage. Calculate the high speed shaft overhung load.

#### Solution:

$$\text{Reducer input RPM} = \frac{1,750 \times 5.5}{8.2} = 1,170 \text{ RPM}$$

for L<sub>f</sub> reference **Table 8 on page 53**

$$\text{O.H.L.} = \frac{126,000 \times 10 \times 1.5 \times 1.02}{8.2 \times 1,170} = 201 \text{ lbs.}$$

**Table 10, page 54** - 1170 RPM yields an overhung load capacity of 1,060 pounds for the Atlas series reducer. The actual load of 201 pounds is less than the capacity rating and is acceptable for this selection.

#### Low Speed Shaft

The load locations factor (L<sub>f</sub>) are shown in **Table 9, page 53**. The overhung load capacity ratings for low speed shafts are listed in **Table 11, page 54**.

#### Example:

A 10 HP, 1,750 RPM motor is directly connected to a Mars reducer having a ratio of 24.00 (72.92 RPM output). A 120B21 10.064" P.D. roller chain sprocket is mounted so that the centerline of the load is 2-3/4 inches from the seal cage. Calculate the low speed shaft overhung load.

#### Solution:

$$\text{O.H.L.} = \frac{126,000 \times 10 \times 1.0 \times 1.04}{10.064" \times 72.92} = 1,786 \text{ lbs.}$$

The overhung load rating listed in **Table 11, page 54**, for the Mars reducer at a ratio of 24.00 is 3,620 pounds. The actual load of 1,786 is less than the rated capacity and is acceptable for this application.

Published values of overhung loads in **Tables 10 and 11** are based on the load being applied at 1 shaft diameter away from the seal cage.

Shaded areas that are bold require an electric fan.

Shaded areas that are bold and italicized require an alternate lubricant to achieve selection, contact factory for lubrication specification.

Shaded areas require a cooling option.

\* Selections are based on 1750 RPM, NEMA B, T-Frame motors. If other motor types, speeds, or HP's > 250 are required, refer application to factory. Additional ratios are available as standard items. Contact Rexnord for application details.

‡ Example: "VENS 19" requires a Venus size reducer rated for 19,000 lb-in torque.

- d = double reduction
- t = triple reduction
- q = quadruple reduction
- qu = quintuple reduction

Shaded areas that are **bold** require an electric fan.

Shaded areas that are **bold and italicized** require an alternate lubricant to achieve selection, contact factory for lubrication specification.

Shaded areas require a cooling option.

\* Selections are based on 1750 RPM, NEMA B, T-Frame motors. If other motor types, speeds, or HP's > 250 are required, refer application to factory. Additional ratios are available as standard items. Contact Rexnord for application details.

‡ Example: "VENS 19" requires a Venus size reducer rated for 19,000 lb-in torque.

- d = double reduction
- t = triple reduction
- q = quadruple reduction
- qu = quintuple reduction

Shaded areas that are bold require an electric fan.

Shaded areas that are bold and italicized require an alternate lubricant to achieve selection, contact factory for lubrication specification.

Shaded areas require a cooling option.

\* Selections are based on 1750 RPM, NEMA B, T-Frame motors. If other motor types, speeds, or HP's > 250 are required, refer application to factory. Additional ratios are available as standard items. Contact Rexnord for application details.

‡ Example: "VENS 19" requires a Venus size reducer rated for 19,000 lb-in torque.

- d = double reduction
- t = triple reduction
- q = quadruple reduction
- qu = quintuple reduction

Shaded areas that are **bold** require an electric fan.

Shaded areas that are **bold and italicized** require an alternate lubricant to achieve selection, contact factory for lubrication specification.

Shaded areas require a cooling option.

\* Selections are based on 1750 RPM, NEMA B, T-Frame motors. If other motor types, speeds, or HP's > 250 are required, refer application to factory. Additional ratios are available as standard items. Contact Rexnord for application details.

† Contact Rexnord for application details.

‡ Example: "VENS 19" requires a Venus size reducer rated for 19,000 lb-in torque.

t = triple reduction

q = quadruple reduction

Shaded areas that are bold require an electric fan.

Shaded areas that are bold and italicized require an alternate lubricant to achieve selection, contact factory for lubrication specification.

Average ambient temperature below 84 °F. See selection procedures page 5 for higher ambient temperatures.

\* Selections are based on 1750 RPM, NEMA B, T-Frame motors. If other motor types, speeds, or HP's > 250 are required, refer application to factory. Additional ratios are available as standard items. Contact Rexnord for application details.

‡ Example: "VENS 19" requires a Venus size reducer rated for 19,000 lb-in torque.

d = double reduction

t = triple reduction

q = quadruple reduction

qu = quintuple reduction

## Couplings with Straight Bore Hubs

**NOTE:**  
Hub/shoulder design varies per coupling size. Consult Rexnord for specific size assembly drawings.

(1) Service factor = 1.0

(2) With max. bore standard hubs

### NO OTHER COUPLING CAN OFFER ALL THESE FEATURES

- **Rapid and Easy Assembly/Disassembly** — Element consists of two halves split longitudinally. Allows for "inplace" removal/installation. No need to move connected equipment.
- **Protects Equipment** — The super flexible polyurethane element "cushions shock loads" and accommodates up to 4° angular or 3/16" parallel misalignment.
- **Reduces Vibration** — Less "wear and tear" on connected equipment. Longer system life.
- **Safe** — No metal-to-metal contact between driver and driven components. Non-sparking. Reduces the risk of fire.
- **Visual Inspection** — No need to disassemble coupling. The element can even be inspected "on-the-fly" using a strobe light.
- **Chemical Resistance** — Highly resistant to oils, corrosion and most chemicals.
- **Less Inventory** — Standard and spacer hubs are interchangeable. Adjustable spacer design meets most shaft spacing requirements without additional parts.
- **Lower Maintenance Cost** — No lubrication or service required.

CONSULT FACTORY

CONSULT

FACTORY

To attain  $WR^2$  at reducer low speed shaft (output), multiply  $WR^2$  of reducer high speed shaft by the exact ratio squared.

\* Mercury/Mars 159.8 ratio is a triple reduction.

\* All values are approximate, contact factory for exact values.

# INSTALLATION AND MAINTENANCE INFORMATION

## Introduction

The following instructions apply to all standard horizontally mounted Planetgear™ speed reducers. To assure long life and performance of Planetgear speed reducers, the following practices should be followed.

## Nameplate

Operation of the reducer shall not differ from the application data warranted on the nameplate. Any change from this data requires submittal of new application information along with all nameplate data to the factory for engineering approval. All data changes require a new nameplate be issued and installed on the reducer. Note location of serial number and model number on the nameplate. When contacting the factory or sales representative, have the serial number and model number available as these unique numbers fully describe the reducer and allow for the fastest and most accurate exchange of information.

## Spare and Repair Parts

When ordering parts, always give complete data from the nameplate on the Planetgear reducer. Model number and serial number information is necessary. Complete nameplate data will assure that you are receiving the correct parts. If a new nameplate is received with the new parts, (as when a drive ratio is changed), replace the old nameplate on the drive with the new nameplate for future reference. Sun gears and carrier assemblies are stamped with a part number for easy identification.

## Installation

All speed reducers should be mounted on a vibration-free, solid, level foundation. The normal method of mounting is horizontal. However, the unit may be oriented in other positions, including vertical. Relocation of the oil fill, oil drain, and oil level plugs may be necessary. Vertical mounting requires an oil reservoir kit. Please indicate mounting orientation if other than horizontal when ordering.

### Foundation, Steel

When mounting the unit on structural steel, use of a rigid baseplate is strongly recommended. The baseplate should be designed to minimize bending, twisting, and localized bending between stiffeners. The baseplate must be flat to prevent distortion of the reducer. The baseplate should extend the entire length of the unit. Bolt the unit securely to the structural steel support.

### Foundation, Concrete

For best results, grout structural steel mounting pads into the mounting base. The reducer is then installed and shimmed off the structural pads. If shims are used to level or align the unit, they should be distributed evenly under all mounting pads to equalize the support load. Use a feeler gauge to determine thickness of required shims. All pads must be squarely supported to prevent distortion of the housing when the unit is bolted down.

## Alignment

Align reducer with driven equipment by placing broad flat shims under all mounting pads of the reducer. Start at the low speed end and level across the length and width of the reducer. Check with feeler gauge to make certain that all pads are supported to prevent distortion of housing when reducer is bolted down. After reducer is aligned with driven equipment and bolted down, align prime mover to the reducer input shaft.

If reducer is received coupled to a motor, it has been aligned at the factory. However, because alignment may have been disturbed in shipment, it is best to check alignment and realign if necessary. The reliability and long life of the reducer requires careful installation of accessories and accurate alignment of the connecting shafts.

If the reducer is mounted onto a Planetgear baseplate and must be direct coupled to a drive shaft, shimming should be done underneath the baseplate. Shim under the baseplate until the baseplate is level and all feet are on the same plane.

*After first week* — Check alignment of the total system and realign if necessary. Also tighten all bolts and plugs as required. Remember to remove the load from the system before attempting to service the reducer. This action reduces the possibility of unexpected motion in the system. Check coupling for alignment to make sure that setting or vibration has not caused excessive misalignment.

## Coupling Alignment

Detailed instruction for installation of Rexnord Elastomer couplings are available from the factory, your Sales Engineer, or local distributor. The following are general instruction:

- Correct for angular misalignment by measuring the distance from coupling hub (on motor shaft) to coupling hub (on reducer input shaft) at four places each 90 degrees apart. Adjust or shim until the four readings are equal.
- Correct for parallel offset misalignment by placing a straight edge across the hub flange in two places 90 degrees apart. Adjust or shim until the straight edge lays flat on both ends.
- Recheck for angular misalignment, adjust if necessary and tighten down the connected equipment.
- Install Elastomer center member elements. Tighten all cap screws to the correct torque value listed in the coupling installation sheet.

## Face Mounted Scoops

The scoops have been designed to accommodate the motor weight and the starting torque based on the correct selections in this catalog and using standard 1750, 1430, 1170 and 950 AC motors. If a customer feels deflection is excessive, we suggest either placing a support under the end of the scoop, or drilling a hole in the end of the face scoop and installing a jack screw.

## Sprocket, Pulley and Sheave Connections

Mount power takeoff as close as possible to the gear case in order to reduce the cantilever effect of overhung loads on the shaft bearings. If the power takeoff has only one hub, that hub should be on the outside with the plate closest to the seal cage of the reducer. Adjust belts or chains to manufacturer specifications to prevent overtightening.

Jupiter Plus	—	32.0	32.0	32.0	—

( ) - Gallon capacities for vertically orientated speed reducers

### Petroleum Based R & O and Extreme Pressure (EP) Lubricants

Industrial type petroleum R & O and extreme pressure (EP) lubricants are common and readily available general purpose gear lubricants. The EP lubricants currently recommended are of the sulfur-phosphorus type.

### WARNING: EP LUBRICANTS IN FOOD PROCESSING INDUSTRY -

EP Lubricants may contain toxic substances and should not be used in the food processing industry without the lubricant manufacturers' approval. Lubricants which meet NSF (formerly USDA) "H1" classification are suitable for food processing applications.

### Synthetic Extreme Pressure (EP) Lubricants

Synthetic Extreme Pressure (EP) lubricants of the polyalphaolefin type are recommended for all operating conditions, and are particularly well suited for cold climate operations, high temperature applications, extended temperature range (all season) operations, and/or extended lubricant change intervals. The proper viscosity grade of synthetic lubricant is given in table 20. Refer to Table 21 for Synthetic lubricants.

### WARNING: SYNTHETIC LUBRICANTS IN FOOD PROCESSING INDUSTRY-

Synthetic Lubricants may contain toxic substances and should not be used in the food processing industry without the lubricant manufacturers' approval. Lubricants which meet NSF (formerly USDA) "H1" classification are suitable for food processing applications.

### Grease Lubricated Seals

Planetgear™ 7000 drives are furnished with grease purged seals which minimize the entry of contaminants into the drive. Drives are shipped with K2K #2 grease in the seal housing cavities unless otherwise specified. If grease could contaminate the product, as in the food and drug industries, it should be removed. A grease that meets NSF (formerly USDA) "H1" classification is suitable for food processing applications. Refer to Table 22 for grease recommendations.

# INSTALLATION AND MAINTENANCE INFORMATION

## LUBRICANT CHANGES

### Oil

For normal conditions, **change oil every six months or 2,500 hours**, whichever comes first. If operating under abnormal conditions such as high temperature, severe duty, moisture or particle contamination, oil may need to be changed more frequently. **Reference Owners' Manual** for maintenance.

**Note: Most lubricant suppliers can test oil from the unit periodically and recommend economical oil change schedules. Oil samples should be taken from the oil level hole, not the drain hole.**

### Grease

All reducers are furnished with grease purgeable seals, thus minimizing entry of water or abrasive dust into the reducer. The reducers are shipped with the grease cavity filled with K2K (No. 2). For normal conditions, change grease every six months or 2,500 hours, whichever comes first. Under extreme conditions, grease may need to be changed more frequently.

## STORED AND INACTIVE REDUCERS

**Preparation For Storage** — If a reducer is to be stored or is inactive after installation, drain oil from housing and spray all internal parts with a rust preventative oil that is soluble in a lubricating oil. Seal the reducer completely, and replace the vent plug with a solid pipe plug to keep rust inhibiting atmosphere sealed inside.

Periodically inspect stored or inactive reducers and add rust inhibitor every six months or more often if necessary. Dry indoor storage is recommended.

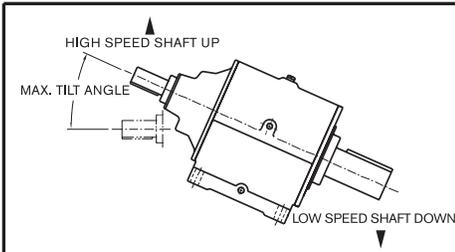

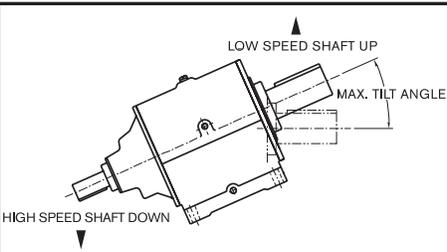

Rotate shafts every three months to keep the bearings from becoming lacquered.

**Preparation For Start-up** — Fill reducer to proper oil level, using enclosed oil capacity chart, with the recommended lubricant. Remember, reducers are supplied from the factory without oil. Rotate shafts until the bearings move freely. You are now ready to start the unit up.

## NON-HORIZONTAL SERVICE

Planetgear speed reducers can be installed on an incline or in the vertical orientation. Contact factory or sales representative if the reducer is mounted in a rotated position with respect to the drive line.

Note: If any reducer application exceeds max. allowable tilt, consult factory or sales representative for possible modifications.

# INSTALLATION AND MAINTENANCE INFORMATION

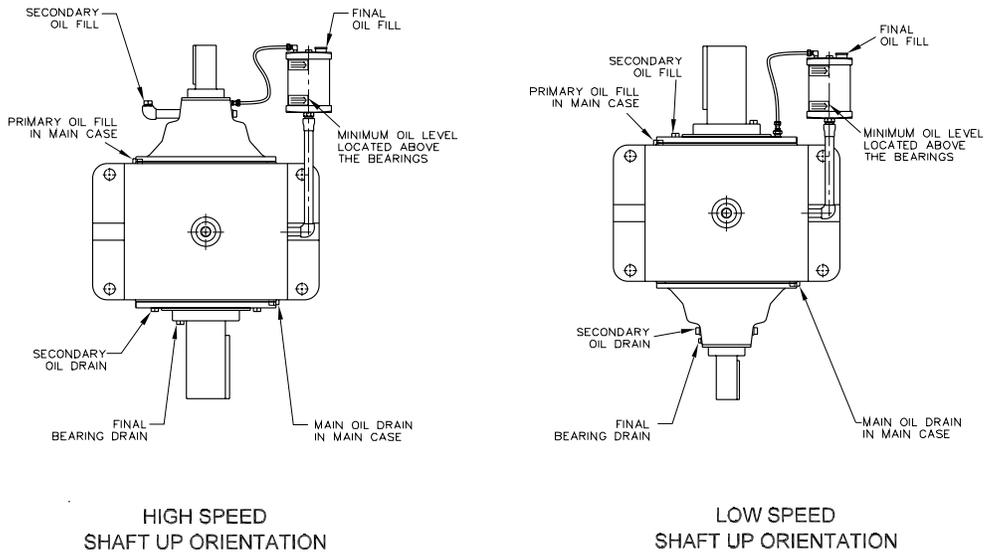

## VERTICAL SERVICE

Mercury, Mars, Venus, Atlas, Luna, Earth, Polaris, and Delta speed reducers can be mounted vertically with the high speed shaft up or down. Vertical service for the Neptune, Neptune Plus, and Orion Plus speed reducers is available with input shaft up only. Contact factory or sales representative for all other vertical options. Standard reducers are not designed for vertical applications. **Modifications are made at the factory to convert a standard reducer for vertical service. Contact factory or sales representative with any other applications.**

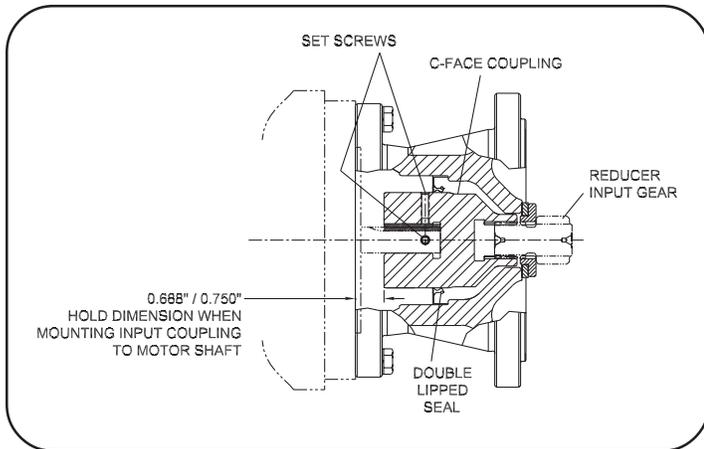

Planetgear speed reducers used in a vertical orientation or most inclined orientations require an oil reservoir lubrication system. Any mounting orientation other than horizontal must be stated during order placement so Planetgear can determine if a reservoir kit is required.

The reservoir kit works by providing an adequate head of oil to lubricate the uppermost bearing, while allowing for oil expansion. A plastic tube acts as a purge line to eliminate trapped air below the seals.

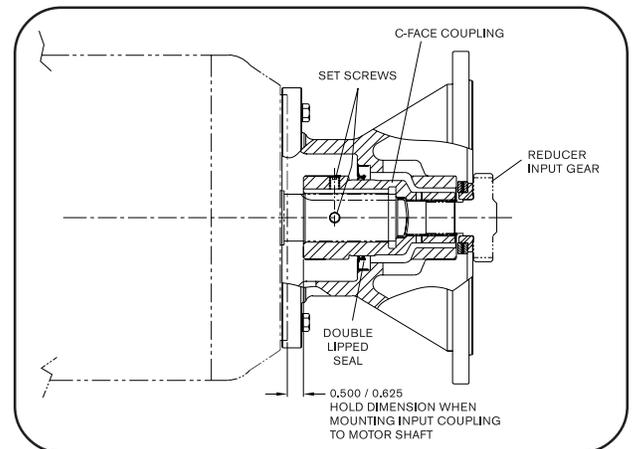

Assemble components as shown in the figure below. It is difficult to determine all potential field installation interference points. If necessary, please substitute different pipe fittings as required. In doing so, **it is important that the bottom of the reservoir is at or above the uppermost bearing.** Holes have been drilled by the factory to facilitate both right hand or left hand oil reservoir mounting. Apply pipe sealant to all threaded connections during assembly.

**FIGURE 1**  
**C-FACE SECTIONAL VIEWS**

Mercury/Mars (single, double, triple, & quadruple reductions)  
Venus/Atlas/Luna (quadruple reduction)  
Earth/Polaris/Delta (quadruple reduction)

Venus/Atlas/Luna (single, double, triple, & quadruple reductions)  
Earth/Polaris/Delta (single, double, triple, & quadruple reductions)  
Neptune/Neptune Plus/Orion Plus (quadruple & quintuple reductions)

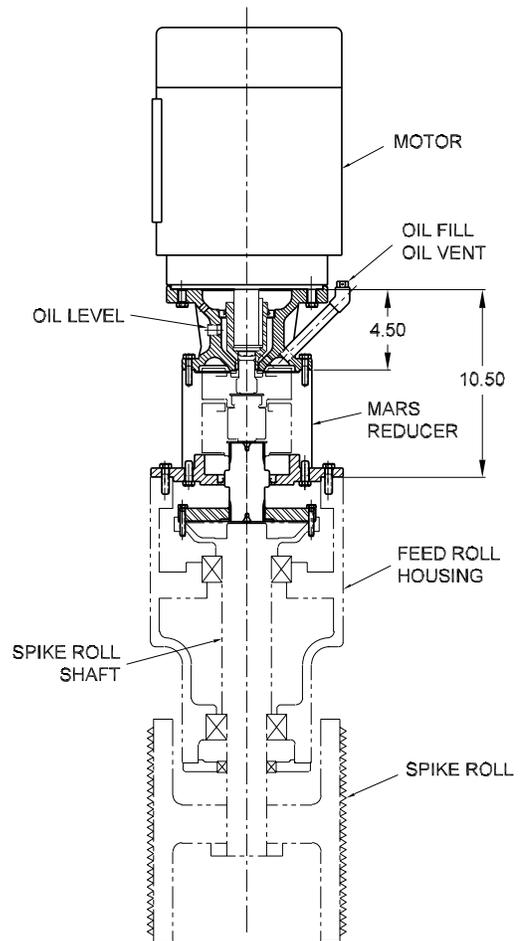

# SPECIALTY ENGINEERED PRODUCTS

## Feed Roll Drives

### FEED ROLL DRIVE REPLACEMENT

- ✓ No timing of gears required
- ✓ Durable, reliable operation due to self-aligning gear train
- ✓ Drop-in replacement
- ✓ Vertical or horizontal service
- ✓ Exact ratios: (10.24, 14.06, 17.50, 18.29, 21.78, 24.38, 26.67, or 30.33)

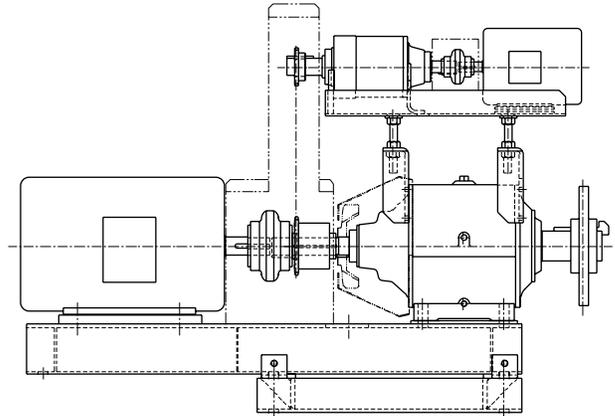

# SPECIALTY ENGINEERED PRODUCTS

## Inching Drives

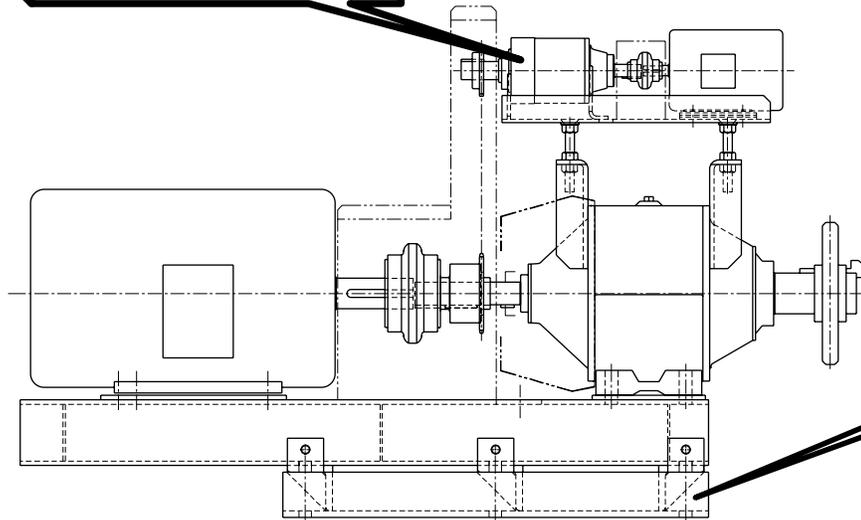

### PURPOSE

Primarily used for inspection of equipment to eliminate shock to the system caused by jogging the main motor.

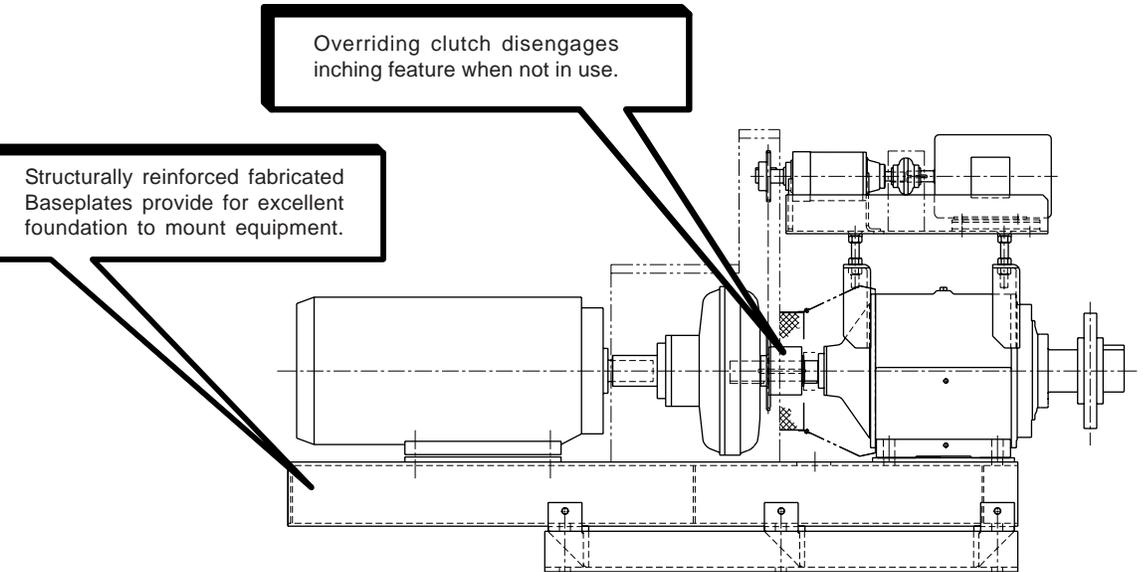

- Available in all sizes and ratios
- Supplied with or without motors
- Consult Factory for detailed information

Secondary reducer/motor package offers an additional 10:1 reduction in inching mode.

If drive shaft is chain driven, our Slidebase facilitates tensioning of the chain.

Overriding clutch disengages inching feature when not in use.

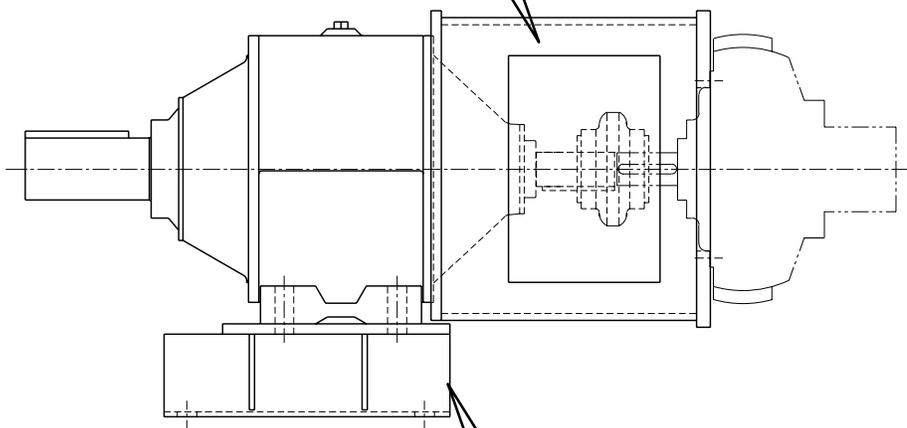

Structurally reinforced fabricated Baseplates provide for excellent foundation to mount equipment.

# SPECIALTY ENGINEERED PRODUCTS

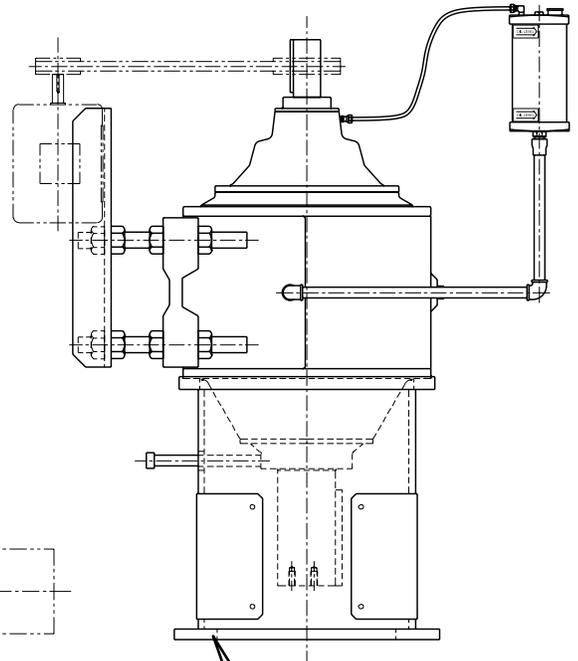

## Custom Designed Adapters

Planetgear™ 7000 can offer special and standard input, output and reducer mounting adapters to meet most customer needs. Contact Factory with requirements.

Input C-face motor adapter allows use of flexible coupling for higher shock applications.

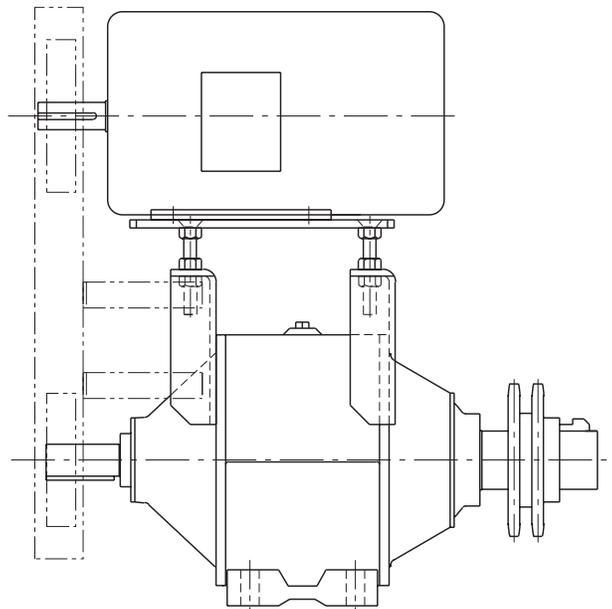

Reducer interchange adapters allow Planetgear reducers to drop into most mounting configurations.

Output side mounting adapter allows for convenient mounting to existing structures.

Complete packages available with belts, belt guard and sheaves.

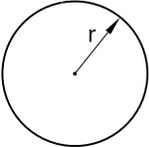

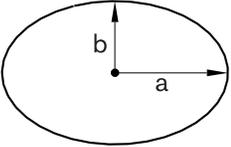

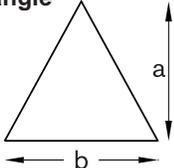

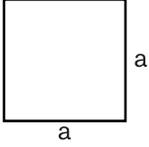

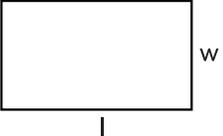

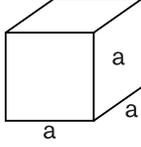

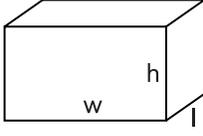

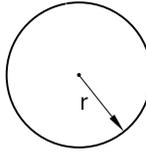

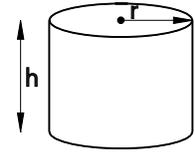

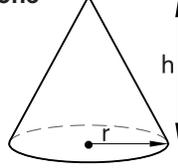

# GENERAL ENGINEERING INFORMATION

## General Power Transmission Formulas

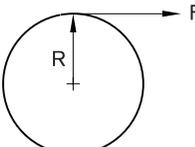

The following information helps to solve technical problems frequently encountered in the selection of power transmission components.

AREAS OF PLANE FIGURES	
FIGURE	AREA
<b>Circle</b> 	$\pi r^2$ circumference = $2\pi r$
<b>Ellipse</b> 	$\pi ab$
<b>Triangle</b> 	$\frac{1}{2}ab$
<b>Square</b> 	$a^2$
<b>Rectangle</b> 	$lw$

VOLUMES AND SURFACE AREAS OF SOLIDS		
SOLID	SURFACE AREA	VOLUME
<b>Cube</b> 	$6a^2$	$a^3$
<b>Rectangular Prism</b> 	$2hw + 2hl + 2lw$	$l \times w \times h$
<b>Sphere</b> 	$4\pi r^2$	$\frac{4\pi r^3}{3}$
<b>Cylinder</b> 	$2\pi rh + 2\pi r^2$	$\pi r^2 h$
<b>Cone</b> 	$\pi r \sqrt{r^2 + h^2}$ (+ $\pi r^2$ if you add the base)	$\frac{\pi r^2 h}{3}$

# GENERAL ENGINEERING INFORMATION

## General Power Transmission Formulas

WEIGHT	
FORMULA	VARIABLES
WEIGHT (W) = V x p (lbs)	V = Volume (cubic inches) p = Material density (lbs per cubic inches)
TORQUE	
TORQUE (T) = F x R (lb-in)	F = Force (lbs) R = Perpendicular distance from the center of rotation to the force (in)
	
HORSEPOWER (HP)	
<ul style="list-style-type: none"> <li>Rotating Objects</li> </ul> $HP = \frac{T \times RPM}{63,025}$	T = Torque in inch-pounds (lb-in) RPM = Shaft speed revolutions per minute (rpm)
<ul style="list-style-type: none"> <li>Objects in Linear Motion</li> </ul> $HP = \frac{F \times V}{33,000}$	F = Force in pounds (lbs) V = Velocity in feet per minute (fpm)
<ul style="list-style-type: none"> <li>Hydraulic</li> </ul> $HP = \frac{GPM \times PSI}{1,714}$	GPM = Flow rate in gallons per minute (gal/min) PSI = Pressure in pounds per square inch (lb/in <sup>2</sup> )

LINEAR TO ROTARY MOTION	
FORMULA	VARIABLES
$N = \frac{V}{0.262D}$	N = Speed of shaft rotation (rpm) V = Velocity of material (fpm) D = Diameter of pulley or sprocket (in)
ACCELERATION / DECELERATION OF TORQUE AND FORCE	
<ul style="list-style-type: none"> <li>Rotating Objects</li> </ul> $T = \frac{WK^2 \Delta N}{308t}$	T = Torque required (lb-ft) WK <sup>2</sup> = Total inertia of load to be accelerated (lb-ft <sup>2</sup> ) ΔN = Change in speed (rpm) t = Time to accelerate load
<ul style="list-style-type: none"> <li>Objects in Linear Motion</li> </ul> $F = \frac{W \Delta V}{1,933t}$	F = Force required (lbs) W = Weight (lbs) ΔV = Change in velocity (fpm) t = Time to accelerate load

TEMPERATURE		
TO CONVERT FROM	TO	USE FORMULA
temperature Celsius, t <sub>C</sub>	temperature Kelvin, t <sub>K</sub>	t <sub>K</sub> = t <sub>C</sub> + 273.15
temperature Fahrenheit, t <sub>F</sub>	temperature Kelvin, t <sub>K</sub>	t <sub>K</sub> = (t <sub>F</sub> + 459.67) / 1.8
temperature Celsius, t <sub>C</sub>	temperature Fahrenheit, t <sub>F</sub>	t <sub>F</sub> = 1.8 t <sub>C</sub> + 32
temperature Fahrenheit, t <sub>F</sub>	temperature Celsius, t <sub>C</sub>	t <sub>C</sub> = (t <sub>F</sub> - 32) / 1.8
temperature Kelvin, t <sub>K</sub>	temperature Celsius, t <sub>C</sub>	t <sub>C</sub> = t <sub>K</sub> - 273.15
temperature Kelvin, t <sub>K</sub>	temperature Fahrenheit, t <sub>F</sub>	t <sub>F</sub> = 1.8 t <sub>K</sub> - 459.67
temperature Kelvin, t <sub>K</sub>	temperature Rankine, t <sub>R</sub>	t <sub>R</sub> = 9/5 t <sub>K</sub>
temperature Rankine, t <sub>R</sub>	temperature Kelvin, t <sub>K</sub>	t <sub>K</sub> = 5/9 t <sub>R</sub>

# GENERAL ENGINEERING INFORMATION

## STANDARD KEY AND SETSCREW SIZES

**KEYSEATS AND KEYS** Drawings and formulas at right illustrate how the depth and width of standard keyseats in shafts and hubs are determined. Refer below to explanation of symbols.

### SYMBOLS:

- C = Allowance or clearance for key (normally 0.005" for parallel keys).
- D = Nominal shaft or bore diameter (in)
- H = Nominal key height (in)
- W = Nominal key width (in)
- Y = Chordal height (in)

$$Y = \frac{D - \sqrt{D^2 - W^2}}{2}$$

Shaft Diameters		Key W x H	Set Screw	Shaft Diameters		Key W x H	Set Screw	Shaft Diameters		Key W x H	Set Screw	Shaft Diameters		Key W x H
Over	Thru			Over	Thru			Over	Thru			Over	Thru

## BOLT TORQUES

TORQUE REQUIREMENTS FOR DRY BLACK FASTENERS		
SAE	GENERAL PURPOSE GRADE 2	HIGH STRENGTH GRADE 5
DIA.	TORQUE ( ft. lbs. )	TORQUE ( ft. lbs. )
1/4	6	9
5/16	12	18
3/8	21	33
7/16	34	53
1/2	52	80
9/16	75	116
5/8	104	160
3/4	184	285
7/8	178	460
1	265	690
1 1/8	380	850
1 1/4	530	1200
1 3/8	700	1570
1 1/2	930	2080

- The torques shown produce a clamp load of 80% of proof load. They assume clean, dry threads with a torque coefficient of 0.2.
- Plated threads need only 3/4 torque shown.
- Well lubricated threads need only 1/2 torque shown.

**ALL PLANETGEAR SPEED REDUCERS USE GRADE 5 FASTENERS.**

# GENERAL ENGINEERING INFORMATION

## Motor Operating Parameters and Formulas

**NEMA STANDARDS** Electric motors are required to meet certain industrial safety and manufacturing standards. The accepted authority in the U.S.A. is the National Electrical Manufacturers Association — an organization that sets voluntary standards for acceptable practice for the motor industry. For example, they specify standard frame sizes, ratings, torque, and horsepower classifications — as well as dimensions, performance, testing, etc.

### MOTOR ELECTRICAL FORMULAS

TO FIND	Alternating Current		TO FIND	ALTERNATING OR DIRECT CURRENT
	Single-Phase	Three-Phase		
Amperes when Horsepower is known	$\frac{HP \times 746}{E \times Eff \times pf}$	$\frac{HP \times 746}{1.73 \times E \times Eff \times pf}$	Amperes when voltage and resistance are known:	E / R
Amperes when kilowatts are known	$\frac{KW \times 1,000}{E \times pf}$	$\frac{KW \times 1,000}{1.73 \times E \times pf}$	Voltage when resistance and current are known:	IR
Amperes when Kva are known	$\frac{Kva \times 1,000}{E}$	$\frac{Kva \times 1,000}{1.73 \times E}$	Resistance when voltage and current are known:	E / I
Kilowatts	$\frac{I \times E \times pf}{1,000}$	$\frac{1.73 \times I \times E \times pf}{1,000}$	I = Amperes E = Volts Eff = Efficiency pf = Power Factor KW = Kilowatts R = Ohms Kva = Kilovolt Amperes	
Kva	$\frac{I \times E}{1,000}$	$\frac{1.73 \times I \times E}{1,000}$	General Information (Approximation) All Voltages at 100% Load At 1,800 rpm, a motor develops a 36 lb-in per HP At 1,200 rpm, a motor develops a 54 lb-in per HP At 575 volts, a three-phase motor draws 1 amp per HP At 460 volts, a three-phase motor draws 1.25 amp per HP At 230 volts, a three-phase motor draws 2.5 amp per HP At 230 volts, a single-phase motor draws 5 amp per HP At 115 volts, a single-phase motor draws 10 amp per HP	
Horsepower = (Output)	$\frac{I \times E \times Eff \times pf}{746}$	$\frac{1.73 \times I \times E \times Eff \times pf}{746}$		
<b>For variable descriptions, see chart at right.</b>				

### MOTOR AMPS AT FULL LOAD

HP	Alternating Current		DC	HP	Alternating Current		DC	HP	Alternating Current		DC	HP	Alternating Current		DC
	Single Phase	Three Phase			Single Phase	Three Phase			Single Phase	Three Phase			Single Phase	Three Phase	
1/2	4.9	2.0	2.7	5	28	14.4	20	25	—	60	92	75	—	180	268
1	8.0	3.4	4.8	7 1/2	40	21.0	29	30	—	75	110	100	—	240	355
1 1/2	10.0	4.8	6.6	10	50	26.0	38	40	—	100	146	125	—	300	443
2	12.0	6.2	8.5	15	—	38.0	56	50	—	120	180	150	—	360	534
3	17.0	8.6	12.5	20	—	50.0	74	60	—	150	215	200	—	480	712
Values are for all speeds and frequencies at 230 volts. Amperage for other than 230 volts can be calculated as follows: $I = \frac{230 \times \text{Amps from Table}}{\text{New Voltage}}$								Example: For 40 HP, three-phase at 550 volts $I = \frac{230 \times 100}{550} = 42 \text{ amps}$ Power Factor estimated at 80% for most motors. Efficiency is usually 80-90%.							

### OBSOLETE MOTOR SHAFT DIMENSIONS

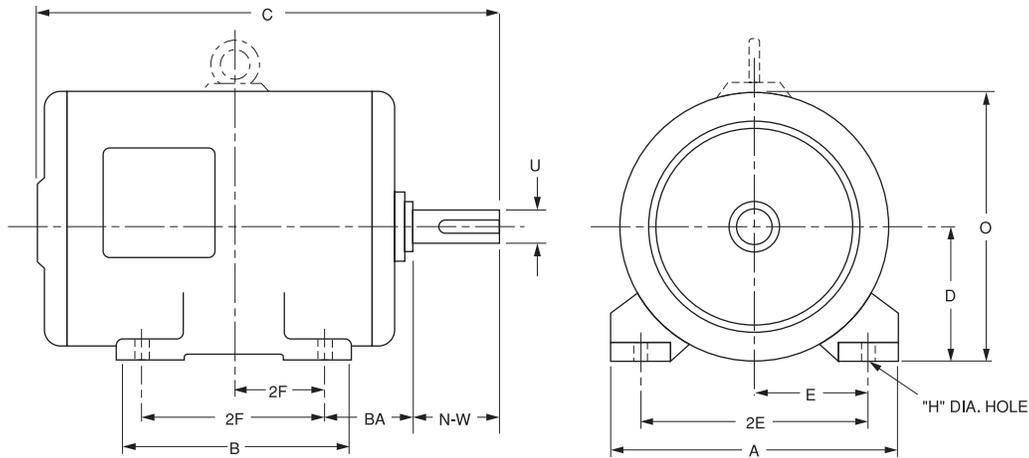

Motor ratings and dimensions shown in the table below are the obsolete or 1953 NEMA "U" frame standards. These were replaced by the 1963 re-rating program which established the present "T" frames. In effect, a larger motor shaft and hp rating is obtained compared to the corresponding "U" frame sizes.

### U-FRAME NEMA ASSIGNMENTS AND DIMENSIONS

NOTE: Suffix "S" indicates short shaft for direct coupled service only. Motors of 25 hp and up listed as T-Frame may also be available in TS-Frames.  
 ‡ These dimensions are not NEMA standard, but they are average and common to a number of manufactures for Open (Drip Proof) motors. TEFC motors will be up to 5 inches longer, and may be slightly taller (less than an inch difference).  
 \* Usable length of shaft "V" is 1/4 inch shorter than "N-W".

\* Usable length of shaft "V" is 1/4 inch shorter than "N-W".

† Refer to T-Frame chart (page 118) for dimensions not listed.

# GENERAL ENGINEERING INFORMATION

## IEC Electric Motor Dimensions

**IEC STANDARDS** Many countries have adopted IEC Standards, IEC stands for "The International Electrotechnical Commission". The object of the commission is to facilitate the coordination and unification of National Electrotechnical Standards.

IEC motors are in service worldwide. The standards have been incorporated into individual national standards. Outputs are in KW and dimensions are in millimeters. Table below shows the common IEC frame sizes of one motor manufacturer.

Mechanically, the major mounting dimensions of NEMA vs IEC are similar. Each standard has adopted units of dimensions predominant with the country used in.

### IEC THREE-PHASE MOTORS WITH SQUIRREL CAGE ROTOR

KW Rating				IEC Frame No.*			N - W (mm)	E (mm)	F (mm)	BA (mm)
RPM				D (mm)	C	U (mm)				
3000	1500	1000	750							
0.75	—	.25, .37	—	80	—	19	40	63	50	50
1.5	1.1	0.75	—	90	S	24	50	70	50	56

# World Class Customer Service

For more than 100 years, the dedicated people of Rexnord have delivered excellence in quality and service to our customers around the globe. Rexnord is a trusted name when it comes to providing skillfully engineered products that improve productivity and efficiency for industrial applications worldwide. We are committed to exceeding customer expectations in every area of our business: product design, application engineering, operations, and customer service.

Because of our customer focus, we are able to thoroughly understand the needs of your business and have the resources available to work closely with you to reduce maintenance costs, eliminate redundant inventories and prevent equipment down time.

Rexnord represents the most comprehensive portfolio of power transmission and conveying components in the world with the brands you know and trust.

Rexnord is a registered trademark of Rexnord Industries, LLC. Planetgear is a trademark of Rexnord. All rights reserved.
